

Press Release/Open Letter to the CFS/ME Community

Workwell Foundation, a United Charitable Program, announces opening its cardiopulmonary exercise testing services at two new locations. Workwell specializes in the evaluation of disability impairment for Chronic Fatigue Syndrome/Myalgic Encephalomyelitis (CFS/ME), Fibromyalgia Syndrome (FMS) and other fatiguing conditions. Staci Stevens, Christopher Snell and their Workwell colleagues formally operated the Pacific Fatigue Laboratory (PFL) which is now closed. They will continue to build on the PFL's reputation for clinical services, education, research and consulting with the same personnel.

Workwell Foundation's mission is to focus on research concerning the functional aspects of CFS/ME. The goal is to facilitate an understanding of the biological basis for fatigue and provide objectively determined therapeutic interventions to improve quality of life for this population. Workwell's unique contribution is helping patients and their families understand this illness as well as educating health and fitness professionals about CFS/ME.

Workwell Foundation takes over where the Pacific Fatigue Laboratory left off. We are now located at XCEL Physical Therapy, Ripon, CA, and with world renowned CFS/ME specialist Daniel Peterson, MD of Sierra Internal Medicine, Incline Village, NV. Services offered include disability evaluations, provider education and cardiopulmonary exercise testing for clinical and research purposes. Workwell staff members are also available for speaking engagements and bio scientific consulting.
